Report description:

The MEA dental scalers market is expected to grow from US\$ 25.00 million in 2022 to US\$ 29.34 million by 2028; it is estimated to grow at a CAGR of 2.8% from 2022 to 2028.

New technological developments are making it easier for dentists to do their job quickly, safely, and comfortably. Technology makes dental hygiene appointments a much more pleasant experience for patients than they used to be. This increases patient compliance and makes them more willing to schedule treatment and recall visits. Many dentists have already employed software to get insights into clinical decision-making. These developments are likely to lead to the integration of AI algorithms to enable clinicians to find the best modalities for their patients. According to a 2019 study, with the exponential rise in health data and the maturing of healthcare AI, dental medicine is entering a new stage of digitization. Such smart algorithms can be integrated within the healthcare system to analyze health data, research findings, and treatment techniques to offer customized diagnostic and therapeutic recommendations for individual patients. In dental practice, augmented reality (AR) is more prevalent in reconstructive and aesthetic procedures to help patients know what they would look like after the treatment. Intraoral cameras are among the significant advancements in dental instruments as they can be easily used to spot tartar on the teeth of patients. Several companies have launched intraoral cameras on the market. Cameras enabled with the unique liquid lens technology work like the human eye to ensure effortless image capture and deliver clear, detailed images that patients can understand. Intraoral cameras, equipped with AI and AR technologies, offer dentists a clearer view of the mouth and help them clean the tartar using dental scalers.
