### **Report description:**

The global robotic process automation market size reached US\$ 3.1 Billion in 2022. Looking forward, IMARC Group expects the market to reach US\$ 14.8 Billion by 2028, exhibiting a growth rate (CAGR) of 29.76% during 2022-2028.

Robotic process automation (RPA) refers to an advanced software technology that builds, deploys, and manages software robots. It aids in manipulating data, passing data from different applications, triggering responses, or executing transactions. It also assists in streamlining workflows and increasing employee satisfaction, engagement, and productivity by eliminating repetitive tasks from their workdays. Apart from this, it offers greater resilience and higher accuracy, and accelerates transformation, improves compliance and boosts productivity. As it is also scalable, requires minimal investment, and provides a significant return on investment (ROI), the application of RPA is expanding among numerous industry verticals across the globe.

#### **Robotic Process Automation Market Trends:**

Due to the coronavirus disease (COVID-19) outbreak and consequent imposition of lockdown restrictions, there is a considerable rise in the shift towards remote working to comply with government regulations, continue business operations and prevent the spread of the pandemic. This represents one of the key factors driving the market. Moreover, RPA helps in inducing quick execution and the arrangement of a large volume of data in less time than mechanical procedures with reduced overhead expenditure for enterprises. Consequently, it is increasingly being utilized in the banking, financial services, and insurance (BFSI), healthcare, information technology (IT), and telecom industries worldwide. Furthermore, leading players are integrating RPA with advanced technologies, such as machine learning (ML), which is advancing the capabilities of software bots beyond rule-based processes. It is also allowing task execution like human decision-making skills. Additionally, these players are utilizing artificial intelligence (AI) to handle cognitive processes that require skills, such as understanding documents, visualizing screens, and comprehending speech and carrying on conversations and chats.
