systemic conditions such as autoimmune diseases and cancer increases with periodontitis. Several risk factors linked to periodontitis and oral cancer include smoking, alcohol consumption, and the human papillomavirus. According to the World Cancer Research Fund International, with ~377,700 cases recorded globally in 2020, lips and the oral cavity are the most common sites of mouth and oral cancer.

A periodontal disease can lead to the resorption and failure of the alveolar bone, loss of periodontal attachment, and loosening and falling of the teeth. Therefore, the treatment of periodontal disease focuses on eliminating the source of infection, stimulating the synthesis of growth factors, and repairing periodontal tissue defects, ultimately restoring normal morphology and function. Correcting periodontal defects by bone grafting involves grafting materials (bone or bone substitutes) to restore the anatomical morphology of the alveolar bone and the function of the periodontal tissue. Therefore, the growing cases of periodontal diseases and oral cancer contribute to the growth of the Europe Dental Bone Graft Substitute and Barrier Membrane Market .
