- Multi-User License \$4500.00
- Custom Research License \$7500.00

Report description:

India Tartaric Acid Market was valued at USD 25.26 Million in 2024 and is expected to reach USD 28.53 Million by 2030 with a CAGR of 2.25% during the forecast period. Tartaric acid is a naturally occurring organic compound with the chemical formula $C_4H_6O_6$. This white, crystalline powder has a mildly acidic taste and is primarily extracted from grapes, although it is also present in other fruits. In the culinary sector, tartaric acid is utilized as cream of tartar to stabilize egg whites, prevent sugar crystallization, and enhance the texture and volume of baked goods. In the winemaking industry, it aids in stabilizing wine and prevents the formation of tartrate crystals, thereby contributing to the clarity and stability of the wine. It is also used in certain skincare products as an acidulant and pH regulator and serves as a reagent in various chemical processes and formulations. Regulated by major food safety authorities such as the FDA (USA), EFSA (EU), and FSSAI (India), tartaric acid is approved for use in food and beverages within specified limits. The rising consumption of processed foods and the expansion of the pharmaceutical sector are driving demand for tartaric acid. Additionally, the growth of the food and beverage industry in urban and semi-urban areas further supports market expansion. Major consumption hubs include metropolitan areas like Mumbai, Delhi, and Bangalore, where there are significant food processing and pharmaceutical industries. Key production facilities are concentrated in Gujarat and Maharashtra, known for their well-established chemical and food processing sectors. Ongoing advancements in production technology and efficiency are contributing to market growth. Research into more sustainable and cost-effective production methods is also underway. The market is governed by food safety and pharmaceutical standards, which influence the quality and applications of tartaric acid. Compliance with these regulations is essential for market

Scotts International. EU Vat number: PL 6772247784

tel. 0048 603 394 346 e-mail: support@scotts-international.com

www.scotts-international.com

participants. Maintaining high-quality production to meet both domestic and international standards remains a continuous challenge. Potential future growth could be driven by new applications in pharmaceuticals and specialty chemicals, alongside the continued expansion of the food and beverage industry. Advances in production technologies and sustainability practices are expected to shape the future trajectory of the market.

Key Market Drivers

Growing Food and Beverage Industry

Tartaric acid is employed in baking powders as an acidulant, where it reacts with baking soda to produce carbon dioxide, a process essential for leavening baked goods. As the demand for processed and ready-to-eat foods rises, the need for such leavening agents also increases. According to IBEF, the Indian packaged food and beverage industry is witnessing substantial growth, with the market size expected to rise from USD 33.7 billion in 2023 to USD 46.3 billion by 2028. Additionally, food processing units benefit from a complete profit exemption for the first five years and are eligible for 100% foreign direct investment (FDI) in the sector.

Tartaric acid also plays a critical role in soft drinks and carbonated beverages by adjusting acidity levels, which enhances flavor and extends shelf life. The growing consumption of soft and energy drinks drives up the demand for tartaric acid. In the confectionery industry comprising chocolates, candies, and gums tartaric acid is used to manage acidity and improve flavor, leading to increased consumption. In 2022, India was the 35th largest exporter of chocolate globally, with exports valued at USD 125 million, according to OEC World.

Tartaric acid is important for preserving the quality and extending the shelf life of food products by stabilizing pH levels and preventing spoilage. As demand for high-quality, long-lasting foods rises, tartaric acid's role becomes increasingly vital. The growing preference for natural and organic products also benefits tartaric acid, as its natural origins make it a popular choice for manufacturers in this sector. Additionally, the expansion of the food service industry, including restaurants and fast-food chains, leads to increased use of processed ingredients and additives like tartaric acid to maintain consistent quality and flavor.

Rising Demand for Cosmetics and Personal Care Products

In the cosmetics and personal care sector, tartaric acid is utilized in a range of products including soaps, skincare items, sunscreens, and hair care solutions. This ingredient functions as an exfoliant and pH regulator, aiding in the removal of dead skin cells and maintaining the pH balance in products such as facial scrubs, masks, and creams. As consumers seek more effective skincare options, the demand for tartaric acid in personal care products is increasing.

The Indian beauty and personal care market is growing rapidly, driven by rising disposable incomes, greater consumer awareness, and the influence of global beauty trends. This expansion fuels the demand for a variety of ingredients, including tartaric acid, which is used in the formulation of numerous cosmetics and personal care items. According to Invest India, the premium beauty and personal care segment is anticipated to grow at a CAGR of 54% from FY21-26, with fragrances, makeup, cosmetics, and men's grooming expected to experience a CAGR of 20-40% over the same period.

The manufacturing landscape for beauty and personal care products is widespread across India, with notable clusters in Himachal Pradesh, Gujarat, and Maharashtra. Approximately 90% of manufacturing is localized within India. There is an increasing preference for high-performance and premium personal care products that deliver superior benefits. Tartaric acid's properties as a gentle exfoliant and stabilizer make it a valuable ingredient in high-end cosmetics. Its natural origins also align with the growing consumer demand for natural and organic products, enhancing its popularity and demand.

The cosmetics industry is characterized by continuous innovation and the development of new product lines. Tartaric acid's versatile applications contribute to this innovation, further driving its market growth. The expansion of both online and offline retail channels has made personal care products more accessible to a broader audience. As the market for these products grows, so does the demand for key ingredients like tartaric acid, which are crucial for product formulation. Supportive regulatory standards in India ensure the safe and effective use of ingredients such as tartaric acid, maintaining product quality and safety and promoting its use in personal care products.

Key Market Challenges

Regulatory Compliance

The use of tartaric acid across various industries such as pharmaceuticals, food, and cosmetics requires adherence to a broad array of regulations. These regulations differ by product category and demand strict compliance to ensure safety and

Scotts International. EU Vat number: PL 6772247784

tel. 0048 603 394 346 e-mail: support@scotts-international.com

www.scotts-international.com

effectiveness. For example, the Office of the State Drugs Controller in Tamil Nadu specifies under the Drugs and Cosmetics Act of 1940 that sodium potassium tartrate IP is permitted for repacking in amounts of up to 500 grams.

Securing approvals for tartaric acid and its applications involves navigating complex bureaucratic procedures. This includes meeting rigorous quality standards, performing extensive testing, and obtaining certifications from regulatory bodies such as the Food Safety and Standards Authority of India (FSSAI) and the Drug Controller General of India (DCGI).

Regulatory standards are frequently updated to address new safety concerns and technological advancements, necessitating continuous monitoring and adaptation by manufacturers. Compliance demands extensive documentation and reporting, including detailed records of production processes, ingredient sourcing, safety data, and product performance, which can be both cumbersome and time-consuming.

For companies engaged in international trade, aligning with diverse global regulatory standards adds another layer of complexity. Different countries have varying regulations for tartaric acid, complicating efforts to meet multiple regulatory frameworks.

Meeting these regulatory requirements often requires substantial investment in quality control, testing, and documentation processes, impacting manufacturers' profitability and potentially raising the cost of tartaric acid and its final products.

Non-compliance can lead to legal penalties, product recalls, and reputational damage, making effective risk management crucial for maintaining market position and consumer trust.

Competition from Alternatives

Several alternative ingredients, such as citric acid, malic acid, and fumaric acid, can serve similar functions to tartaric acid in industries like food and beverages, pharmaceuticals, and cosmetics. These substitutes often offer comparable or even enhanced properties at potentially lower costs. Many of these alternatives are produced more cost-effectively or are more readily accessible, which can lead to lower prices and make them more appealing to manufacturers. This cost advantage can diminish the market share of tartaric acid.

Some alternatives offer multifunctional benefits or superior performance in specific applications. For instance, citric acid is extensively used as both an acidulant and preservative, and its versatility often makes it a more attractive option than tartaric acid. Furthermore, established alternatives with strong market presence and brand recognition can create competitive barriers, making it difficult for tartaric acid to compete effectively. To overcome these challenges, tartaric acid producers must focus on differentiating their product through superior quality, performance, and unique benefits. They should also seek opportunities for innovation and align with current market trends to maintain a competitive advantage.

Key Market Trends

Emergence of Applications in Agriculture

Tartaric acid is being evaluated as a natural growth regulator, with the potential to promote healthier plant growth and enhance crop yields. Its application in soil conditioning helps adjust pH levels and improve soil health, which in turn facilitates better nutrient availability and boosts crop performance. A study published in Scientific Reports by a group of Indian researchers has shown that both maleic acid and L-tartaric acid are effective in suppressing sprout growth in stored potatoes, outperforming other common sprout suppressants. Additionally, tartaric acid is being integrated into pesticide formulations to enhance their effectiveness and stability. As a chelating agent, tartaric acid binds with metal ions, making them more accessible to plants and helping to correct nutrient deficiencies, thus improving overall plant health.

With a growing emphasis on sustainability, tartaric acid is increasingly being considered an environmentally friendly alternative for various agricultural applications. Its natural origin and biodegradability make it an attractive option for eco-conscious farming practices. In organic farming, where the use of synthetic chemicals is restricted, tartaric acid serves as a natural additive, including as an acidulant in soil treatments. The expanding use of tartaric acid in these agricultural applications reflects a broader trend towards utilizing natural and sustainable materials in farming, which not only enhances crop productivity but also aligns with increasing environmental and health consciousness.

Segmental Insights

Derivative Insights

Based on Derivative, the Potassium Tartrate (Cream of Tartar) emerged as the dominating segment in the Indian market for Tartaric Acid in 2024. The demand for baked goods and processed foods in India is on the rise, driven by factors such as increasing urbanization, evolving lifestyles, and a growing middle class. This trend ensures a consistent and substantial demand

Scotts International. EU Vat number: PL 6772247784

tel. 0048 603 394 346 e-mail: support@scotts-international.com

www.scotts-international.com

for cream of tartar. According to Invest India, the food processing sector's market size is projected to grow from USD 866 billion in 2022 to USD 1,274 billion by 2027. Cream of tartar plays a crucial role in many recipes and formulations, maintaining consistent quality and driving its ongoing demand. It is a key ingredient in baking powders, widely used in the food and beverage industry to stabilize the leavening process by reacting with baking soda to generate carbon dioxide, which causes dough and batter to rise. This makes it essential for producing cakes, cookies, and other baked products. Additionally, cream of tartar stabilizes egg whites and enhances the texture and volume of whipped products like meringues and souffles, which are prevalent in both commercial kitchens and home settings. With a long history of use, cream of tartar has established a strong market presence and is well-recognized by professionals and home cooks alike. Its established production and supply chains make it cost-effective for broad use, reinforcing its dominant position in the market.

Application Insights

Based on Application, Cosmetics & Personal Care Products emerged as the fastest growing segment in the Indian market for Tartaric Acid during the forecast period. There is an increasing consumer emphasis on skincare and personal care, with a growing demand for effective and high-quality skincare products. This trend has led to a greater incorporation of ingredients like tartaric acid in cosmetics. The cosmetics industry is characterized by constant innovation, and the Indian beauty, cosmetic, and grooming market is projected to grow to USD 20 billion by 2025, up from USD 6.5 billion in 2016, as reported by Assocham. This growth is driven by rising disposable incomes and the increasing desire for improved lifestyle and appearance.

Companies are creating advanced formulations that leverage the unique benefits of tartaric acid, such as enhancing skin texture and stability. The influence of global beauty trends and the availability of international brands in India are driving the demand for sophisticated and innovative cosmetic ingredients. For instance, Shoppers Stop has launched an exclusive store for Estee Lauder Group's brands like MAC and Clinique, while Sephora introduced the premium Rare Beauty brand. Additionally, Amazon India has unveiled its global beauty store, featuring over 60 international brands. Effective marketing by personal care brands is increasing consumer awareness of the benefits of products containing tartaric acid, further boosting its demand. The emphasis on sustainability and eco-friendly products also fuels the preference for naturally sourced ingredients like tartaric acid.

Regional Insights

Based on Region, West India emerged as the dominant region in the Indian market for Tartaric Acid in 2024. Gujarat and Maharashtra are major industrial hubs in India, equipped with advanced chemical manufacturing infrastructure and modern facilities for tartaric acid production. These states host numerous chemical companies, creating a strong ecosystem for tartaric acid manufacturing and distribution. Their status as leading sugarcane producers is crucial, as bagasse, a byproduct of sugarcane processing, is a key raw material for tartaric acid. The proximity to this raw material lowers transportation costs and ensures a reliable supply for manufacturers. The western region benefits from sophisticated logistics and transportation networks, facilitating the efficient movement of raw materials and finished goods, which supports smooth production and distribution processes. With a high concentration of industries that utilize tartaric acid such as food and beverage companies, pharmaceutical firms, and cosmetic manufacturers the demand for tartaric acid is substantial. Additionally, the region's economic growth, driven by rising disposable incomes and increased consumer spending, boosts demand for processed foods, beverages, and personal care products that contain tartaric acid. State governments in Gujarat and Maharashtra actively support the chemical sector through favorable policies, incentives, and infrastructure investments, further encouraging the growth of tartaric acid production and related industries.

Key Market Players

□ Kaival Chemicals Private Limited
□ Vizag Chemical International
□ SimSon Pharma Limited
□ Merck Life Science Private Limited
□ Changmao Biochemical Engineering Company Limited
□ Omkar Speciality Chemicals Ltd.
□ Thirumalai Chemicals Limited
□ CHEMVERA SPECIALITY CHEMICALS PVT. LTD.
□ Antares Chem Private Limited

Scotts chemical Ltd.

Report Scope:

In this report, the India Tartaric Acid Market has been segmented into the following categories, in addition to the industry trends which have also been detailed below:

India Tartaric Acid Market, By Type:

- o Natural
- o Synthetic

India Tartaric Acid Market, By Derivative:

- o Potassium Tartrate (Cream of Tartar)
- o Potassium sodium tartrate tetrahydrate (Rochelle Salt)
- o Tartar Emetic
- o L-Tartaric Acid
- o Others

India Tartaric Acid Market, By Application:

- o Food & Beverages
- o Cosmetics & Personal Care Products
- o Pharmaceuticals
- o Others

India Tartaric Acid Market, By Region:

- o West India
- o North India
- o South India
- o East India

Competitive Landscape

Company Profiles: Detailed analysis of the major companies presents in the India Tartaric Acid Market.

Available Customizations:

India Tartaric Acid Market report with the given market data, TechSci Research offers customizations according to a company's specific needs. The following customization options are available for the report:

Company Information

Detailed analysis and profiling of additional market players (up to five).

Table of Contents:

1. Product Overview
 - 1.1. Market Definition
 - 1.2. Scope of the Market
 - 1.2.1. Markets Covered
 - 1.2.2. Years Considered for Study
 - 1.2.3. Key Market Segmentations
2. Research Methodology
 - 2.1. Objective of the Study
 - 2.2. Baseline Methodology
 - 2.3. Key Industry Partners
 - 2.4. Major Association and Secondary Sources
 - 2.5. Forecasting Methodology
 - 2.6. Data Triangulation & Validation
 - 2.7. Assumptions and Limitations
3. Executive Summary
