**Report description:**

Japan bio-acetic acid market is projected to witness a CAGR of 6.82% during the forecast period FY2026-FY2033F, growing from USD 13.36 million in FY2025 to USD 22.65 million in FY2033F. The bio-acetic market in Japan is witnessing exponential growth driven by growing demand for eco-friendly and bio-based chemicals. In addition, environmental conservation policies and government measures are pushing industries to use bio-acetic acid as a greener option compared to petrochemical-based alternatives. Furthermore, advances in fermentation technology are making the production process more efficient, reducing costs, and increasing quality, thus making bio-acetic acid feasible. Moreover, the rising applications of bio-acetic acid in the manufacture of drugs, food preservatives, and vinyl acetate monomers also propels market growth further. Rising emphasis for reducing Japan's carbon emissions and encouraging eco-friendly industrial practices is further anticipated to help the market to grow in the coming times.

In February 2025, Cabinet in Japan passed a bill requiring polluting firms to join CO2 trading. Japanese companies emitting 100,000 tons or more of carbon dioxide annually will be required to participate in the carbon emissions trading system, a measure aimed at reducing global warming. The government will allocate emission allowances to each company every fiscal year, with trading set to begin in fiscal 2027. The system will charge companies based on their CO2 emissions, with a financial penalty for exceeding quotas. The government plans to introduce a surcharge on fossil fuel importers in fiscal 2028 and auction off emission allowances to power companies in fiscal 2033.

Rising Demand For Bio-Based Chemicals

As companies strive for greener operations, bio-acetic acid, derived from sustainable feedstocks, is emerging as a green alternative to petrochemical-based acetic acid. Its use in food preservation, pharmaceuticals, and the synthesis of bio-based vinyl acetate monomer aligns with Japan's environmental aims and customer demand for ecologically friendly products. Government policies and incentives for bio-based chemicals also speed up the process. Additionally, advancements in fermentation technologies are enhancing efficiency and scalability of production, making bio-acetic acid competitive. Due to Japan's emphasis on reduction of carbon emissions and creating sustainable industrial processes, demand for bio-acetic acid will most probably increase consistently. This development has backing from growth in adoption by diverse industries as a result of the dual benefit of sustainability towards the environment as well as high-performance applications, making bio-acetic acid the pillar of the bioeconomy of Japan.

In March 2022, Mitsui Chemicals commissioned a facility for biochemical and bioplastic products made from bio-based hydrocarbons at its subsidiary, Prime Polymer Co., Ltd. The company aims to achieve a circular economy by recycling and converting to bio-based materials. Bio-based production is crucial for achieving carbon neutrality by 2050. Mitsui Chemicals aims to make this shipment of a bio-based hydrocarbon derivative the first step towards promoting the implementation of bio-based chemicals and plastics in society.

#### Carbon Neutrality Driving Japan's Bio-Acetic Acid Market

Japan's vision to become carbon-neutral by the year 2050 is a crucial driver of the bio-acetic acid market in the country. As Japan anticipates reducing the greenhouse gas emission, industry leaders are shifting attention to bio-based chemicals using the renewable feedstock. Bio-acetic acid that is produced by sustainable fermentation is anticipated to be best-positioned to capitalize on the efforts because it offers low carbon compared to the petrochemical-based acetic acid. In addition, the government subsidies and strict environmental regulations are further encouraging them in processes such as food conservation, pharma, and production of vinyl acetate monomer. Furthermore, studies on technologies for bio-manufacturing are making the process more efficient and scalable, and hence more market-friendly to environmentally friendly industries. Given Japan's sharp focus on sustainability and innovation, the market for bio-acetic acid will rise consistently, aligning with the country's broader environmental agenda and fostering industrial growth in harmony with global sustainability trends. This trend underlines the vital contribution of bio-acetic acid to Japan's green revolution in the foreseeable future.

In October 2023, Sumitomo Corporation and Sony Group launched a pilot project to use rice husks as a fossil fuel substitute, silica, and activated charcoal for making Biofuel and Biochemicals. The initiative aims to contribute to decarbonization economically by developing technologies and applications for local production for consumption. With support from Tainai City and the Japan Agricultural Co-operative, the project aims to establish a new business model for decarbonization based on local production for local consumption, with the goal of expanding it globally. The project aims to reduce environmental pollution caused by incineration and dumping of rice husks.

#### Collaboration of International Companies With Domestic Players to Strengthen Supply Network

Globalization is actually connecting international players and domestic players, constructing the stronger supply chain for bio-chemicals such as bio-acetic acid in Japan. These partnerships bridge the expertise of global champions in green technologies with the comfort of local players, connecting to form synergies that enhance scalability and efficiency in production. Through integration of innovative bio-manufacturing technologies, such partnerships foresee robust supply chains of bio-based chemicals that are in easy reach as raw materials and end-products. In addition, such partnerships help in realizing Japan's vision to become carbon-neutral by facilitating the creation of renewable feedstocks and reducing fossil-based chemicals. These activities also aims for achieving sustainability through pioneering methods like carbon recycling and exploiting biomass from crop non-food products, further developing sustainability. Moreover, strategic partnerships are core to the rapid adoption of bio-acetic acid in food safety, pharmaceuticals, and chemicals industries, along with Japan's environmental objectives at large and becoming a global hub in the bioeconomy.

In July 2024, Neste, an oil refining and marketing company partnered with Mitsubishi Corporation to establish a supply chain for renewable plastics and chemicals in Japan. The partnership will supply Japanese brands in sectors like food and apparel, with Neste RE's feedstock for circular plastic production. Mitsubishi will contribute its business development and supply chain management experience.

Biomass is the Dominating Source for Bio-Acetic Acid Production in Japan

www.scotts-international.com

Biomass has emerged as the dominant feedstock for bio-acetic acid production in Japan, driven by Japan's focus on sustainability and reducing dependence on fossil fuels. Agriculture residues, lignocellulosic biomass, and other renewable feedstocks are widely utilized according to their availability and low environmental impact. Enhanced fermentation technology enables efficient conversion of biomass into highly pure bio-acetic acid consistent with Japan's carbon neutrality efforts. Incentives by governments and research projects further increase the use of biomass as a feedstock, influencing innovation in biorefinery technologies. Not only does the process reduce greenhouse gas emissions but also improves the circular economic system through efficient consumption of waste materials. The universal applications of food preservation, pharma, and chemical synthesis bio-acetic acid derived from biomass demonstrate its increasing importance in the bioeconomy of Japan. With the nation continuing to emphasize green industrial operations, biomass will be at the heart of increasing the production of bio-acetic acid in the region.

Future Market Scenario (FY2026 - FY2033F)

- Japan's focus on reducing carbon emissions and promoting eco-friendly practices will drive demand for bio-acetic acid, which is derived from renewable resources and offers a sustainable alternative to traditional acetic acid.
- Innovations in bio-based production processes will enhance efficiency, reduce costs, and improve the competitiveness of bio-acetic acid in various industries.
- Increasing use of bio-acetic acid in pharmaceuticals for drug synthesis and in the food industry as a preservative will boost market growth.
- Supportive government policies aimed at promoting sustainable chemicals will further encourage the adoption of bio-acetic acid in Japan.

Key Players Landscape and Outlook

The Japanese bio-acetic acid market is driven by key players based on innovation, sustainability, and strategic growth. Players are putting a lot of investment into R&D to drive bio-acetic acid production processes to make them cost-effective and efficient. Green manufacturing focus is also aligned with Japan's green regulations, boosting the adoption of bio-based chemicals. Moreover, the players are leveraging advancements in fermentation technology to attain scalability and product quality. Strategic acquisitions and expansions with biotech firms are driving growth in applications such as food preservation, pharma, and vinyl acetate monomer manufacturing. By aligning with Japan's emphasis on technology and sustainability, these players are well placed to benefit from growing demand for bio-acetic acid in every sector.
