North America Human Machine Interface - Market Share Analysis, Industry Trends & Statistics, Growth Forecasts (2025 - 2030)

Market Report | 2025-04-28 | 120 pages | Mordor Intelligence

AVAILABLE LICENSES:

- Single User License $4750.00
- Team License (1-7 Users) $5250.00
- Site License $6500.00
- Corporate License $8750.00

Report description:

The North America Human Machine Interface Market size is estimated at USD 1.29 billion in 2025, and is expected to reach USD 1.99 billion by 2030, at a CAGR of 9.11% during the forecast period (2025-2030).

The key factor contributing to the growth of the market is the increasing adoption of industrial automation across the manufacturing sector. Moreover, other factors, such as the growing demand for smart automation solutions, advancements in the Industrial Internet of Things (IIoT) technology, and the surging need to monitor and increase the efficiency of manufacturing units, are also significantly contributing to the growth of the market.

Key Highlights
- The manufacturers in the region are considered to be one of the most fervent adopters of Industry 4.0. The operational benefits of advanced technologies, such as IoT and big data, have made North American manufacturers more inclined to integrate IoT technologies into their processes. Moreover, the growing number of small and medium enterprises (SMEs) in the region and increasing digitization in manufacturing by various large organizations have also propelled the growth of the IoT in the regional manufacturing market. Therefore, the increasing efforts of the companies in the region to move towards Industry 4.0 operations are expected to propel the demand in the region.
- Demand for automating the industrial process has seen a steady increase. The market has seen significant growth in automation industries, facilitating the demand for Human Machine Interface (HMI) products. HMI helps increase the efficiency of the user and secures the data. The initial high cost associated with deploying such products acts as a challenge to the market's growth. Besides, HMIs are not limited to manufacturing enterprises. It is increasingly used by various enterprises operating in industry verticals like energy, healthcare, and defense.
- Human-machine interfaces communicate with Programmable Logic Controllers (PLCs) and input/output sensors for obtaining and

displaying information for the users to view. The HMI screens can be used for tracking and monitoring or performing other operations, such as controlling the machines.
- Previously, operators were required to walk the floor constantly to review mechanical progress and record it on a whiteboard or a paper for future reference. By allowing PLCs to transmit real-time information straight on an HMI display, the HMI technology significantly eliminates the need for this manual and outdated practice, reducing several problems caused by lack of information or human error.
- Further, HMIs optimize an industrial process as it allows digitization and centralization of data for a viewer. By leveraging HMI, operators can see crucial information and data displayed in charts, graphs, or digital dashboards. Further, it allows them to view and manage alarms and connect with MES and SCADA systems, all through one console.

North America Human Machine Interface Market Trends

Automotive is Expected to Hold Significant Share

- The automotive industry has been witnessing significant advancements over the past several years. Increased emphasis is being given to advanced driver assistance systems (ADAS). Moreover, customers in this segment increasingly demand feature-loaded vehicles that give them more control over the vehicle.
- Additionally, infotainment systems have also witnessed drastic changes over time, with automotive companies increasingly providing large touch panels in vehicles, primarily cars, enabling the users to interact with the vehicle more efficiently. Companies such as Tesla, General Motors, and Ford Motor Company increasingly provide these features in their vehicles to attract more customers.
- Moreover, various automotive companies, such as Tesla, are continuously developing autonomous vehicles that can drive by themselves while keeping the passengers informed about the routes, traffic conditions, speed, and other aspects. Herein, HMI technologies play a vital role in providing real-time information to passengers.
- Modern vehicles already employ a variety of interaction methods that were inconceivable only a few years ago. Drivers use a hands-free HMI system to interact with their vehicle, connected systems within it, and the environment surrounding it. Such advancements in automotive designs promote the adoption of HMIs in the automotive segment.
- For instance, in November 2022, Ford Motor Company announced the launch of a new ultra-high specification ranger platinum pickup with exterior detailing and finishes that enhance the Ranger's characterful design. Also, Ranger Platinum is available in five-seat, double cab specification and is powered by Ford's 3.0-liter V6 turbodiesel engine.
- Also, in recent years, the integration of smartphones with vehicle HMIs has gained prominence in North America. Apple CarPlay and Android Auto allow seamless integration of smartphone apps with the car's display, providing familiar interfaces to drivers. This minimizes the learning curve for using in-car systems and promotes safer usage of smartphone features.
- Furthermore, voice recognition systems, powered by natural language processing, enable drivers to interact with the vehicle using spoken commands. These systems have evolved to understand context, allowing for more conversational interactions. Drivers can adjust settings, make calls, and send messages, all while keeping their hands on the wheel and eyes on the road.

United States To Hold The Largest Market Share

- The North American region is expected to move towards adopting IoT in its operations quickly. This is majorly contributed by countries such as the US. According to the GSMA, the urgency to deploy IoT projects is significantly more substantial in the US than in other countries.
- The US is considered to be an early adopter of various technologies. Many heavy industry companies are accelerating their

digital transformation journeys due to recent global events, particularly in engineering, mining, oil & gas, and manufacturing fields.
- Moreover, OnLogic, a global industrial computer hardware manufacturer and IoT solution provider, announced its plan to build a new 125,000-square-foot global headquarters in South Burlington, Vermont. The new facility accommodates the growing production needs of the company while also providing its local team with an environment fostering continued innovation. Moreover, the USD 50 million project aims to house manufacturing, testing, warehousing facilities, and all other business operations to support the production of the company's small form factor, industrial computers.
- Human Machines Interfaces also provide manufacturers with asset management capabilities. Accuracy in real-time data and reports allows managers to be more efficient and make just the right maintenance plans for businesses. As such, industries are increasingly adopting HMIs to enhance their asset management capabilities.

North America Human Machine Interface Industry Overview

The North American human machine interface (HMI) market is characterized by fragmentation, as numerous companies offer a wide range of hardware, software, and related services. These companies actively pursue strategic partnerships, collaborations, product development, and geographic expansion to expand their customer base and enhance their market share. The market is highly competitive, with several prominent players, including ABB Ltd, Rockwell Automation Inc., Honeywell International Inc., Siemens AG, and Schneider Electric SE, among others.

In November 2022, Mitsubishi Electric introduced two new Graphic Operation Terminals (GOTs) as part of its ongoing commitment to innovation. These newly unveiled GOTs represent the latest additions to the GOT2000 Series Wide Model lineup. They have been specifically designed to cater to the needs of customers who require a larger screen for better data visualization in various contexts, including factory, process, utility, and other automation applications.
