Report description:

The Power to Gas Market is expected to register a CAGR of greater than 50% during the forecast period.

COVID-19 negatively impacted the market in 2020. Presently, the market has reached pre-pandemic levels.

Key Highlights

- Over the long term, the major driving factors of the market were increasing decarbonization to reduce the impact of greenhouse gases on the climate and reduction in the cost of electricity with the advent of renewable energy sources.

- On the flip side, high initial costs to set up power-to-gas plants and the need for additional transportation pipeline infrastructure in underdeveloped and developed economies for methane or hydrogen is expected to slow down the market growth.

- Increasing initiatives in developing the infrastructure of green hydrogen in the emerging markets are expected to create vital opportunities for the power-to-gas market players soon.

- Europe is expected to dominate the power to gas market, with most of the demand coming from countries like Germany, France, and Spain.

Power to Gas Market Trends

Power-to-hydrogen to be the Fastest-growing Segment

- Power-to-hydrogen includes a range of technologies that utilize electricity to perform electrolysis and split water into hydrogen

and oxygen. When hydrogen is manufactured using renewable energy, it is called green hydrogen and can be used to store, transport, and utilize renewable energy. This helps minimize variable renewable energy curtailment from sources such as wind and solar, provides long-term storage and grid-balancing services via electrolyzers, and uses existing gas transmission infrastructure for transporting energy in the form of green hydrogen over long distances.

- Additionally, nearly 350 projects with an aggregate capacity of 54 GW are currently under development and expected to come online by 2030; 40 other projects accounting for almost 35 GW capacity are in the early stages of development. If all planned projects are commissioned within time, it is expected that by 2030, the global green hydrogen supply from electrolyzers could reach 8 million tons per year.

- The green hydrogen produced by electrolyzers can also be used directly as a fuel for transport, replacing oil in light vehicles, railways, and marine applications, or as a feedstock for industrial applications. Green hydrogen fuel cells can also be used for energy storage.

- The technology offers advantages over current energy storage technologies, such as higher power storage capacity and longer discharge times. Hydrogen can also be injected directly into natural gas grids. However, due to safety and technical concerns, hydrogen injection is subject to regulations and varies from country to country. For instance, the limit of hydrogen in natural gas grids in the United Kingdom is 0.1%, while it is 12% in the Netherlands.

- Due to the falling costs of renewable energy technologies like solar and wind, energy storage technologies like power-to-gas (PtG) technology are becoming increasingly attractive. The installed capacity of commercial electrolyzer systems has been growing steadily over the past few years. There are only a few commercially viable water electrolysis technologies, and the two most widely used technologies are alkaline water electrolysis (AWE) and proton exchange membrane (PEM) electrolysis.

- Therefore, owing to the above factors, the power-to-hydrogen segment is expected to be the fastest-growing segment over the forecast period.

Europe to Dominate the Market

- As of 2021, Europe was one of the largest regions in the power-to-gas market. Increasing investments and funding grants by governments in the region are driving the market.

- In 2021, according to the European Commission, the refinery sector accounted for 48% of the hydrogen consumption, followed by the fertilizers and chemical sectors.

- Germany is one of the major countries in the European power-to-gas market. As of 2020, Germany was home to around 40 small power-to-gas pilot projects that harnessed surplus green power, mainly from wind and solar projects, to carry out electrolysis by splitting water into oxygen and hydrogen to produce zero-carbon fuel.

- According to Deutscher Verein des Gas- und Wasserfaches (DVGW), Germany is planning to build a power-to-gas capacity of 5 GW by 2023 and 40 GW by 2050 as it seeks to develop zero-carbon fuels for homes, factories, and vehicles. Thus, such government targets are likely to boost the power-to-gas market in the region during the forecast period.

- In January 2022, ThyssenKrupp Uhde Chlorine Engineers signed a supply contract with Shell for the large-scale project Hydrogen Holland I in Rotterdam, Netherlands port. Under the agreement, ThyssenKrupp Uhde will engineer, procure, and fabricate a 200 MW electrolysis plant based on their large-scale 20 MW alkaline water electrolysis module. The first construction work for the electrolysers that has begun with Shell's final investment decision (FID) to build the project is expected at the end of 2022, after which the intended start of production will be in 2024.

- After the commencement of the Russian-Ukraine war, as a part of the passed in May 2022, the EU aims to reduce overreliance on Russian gas imports by increasing renewable energy generation. One of the primary tenets of the plan is the 'hydrogen accelerator' strategy, which aims to produce 10 million tonnes and import 10 million tonnes of renewable hydrogen into the EU by 2030. As green hydrogen is renewable, the plan aims to support the EU's energy transition and help in the decarbonisation of many heavy industries.

- SImilarly, in May 2022, the EU set up a target with European electrolyzer manufacturers and set up an industry-wide target of

increasing Europe's electrolyser manufacturing capacity from 1.75 GW/year to nearly ten times to 17.5 GW per year by 2025. - Thus, owing to the above factors, Europe is expected to dominate the market during the forecast period.

Power to Gas Industry Overview

The power-to-gas market is moderately consolidated in nature. Some of the major players in the market (in no particular order) include Nel ASA, Sempra Energy, GRT Gaz SA, MAN Energy Solutions, and Sunfire GmbH.

Additional Benefits:

- The market estimate (ME) sheet in Excel format
- 3 months of analyst support

Table of Contents:

1 INTRODUCTION

- 1.1 Scope of the Study
- 1.2 Study Assumptions and Market Definition

2 EXECUTIVE SUMMARY

3 RESEARCH METHODOLOGY

4 MARKET OVERVIEW

- 4.1 Introduction
- 4.2 Market Size and Demand Forecast in USD million till 2027
- 4.3 List of Existing Power-to-gas Plants by Region and Capacity
- 4.4 Recent Trends and Developments
- 4.5 Government Policies and Regulations
- 4.6 Market Dynamics
- 4.6.1 Drivers
- 4.6.2 Restraints
- 4.7 Supply Chain Analysis
- 4.8 Porter's Five Forces Analysis
- 4.8.1 Bargaining Power of Suppliers
- 4.8.2 Bargaining Power of Consumers
- 4.8.3 Threat of New Entrants
- 4.8.4 Threat of Substitute Products and Services
- 4.8.5 Intensity of Competitive Rivalry

5 MARKET SEGMENTATION

- 5.1 By Technology
- 5.1.1 Power-to-Hydrogen
- 5.1.2 Power-to-Methane
- 5.2 By Capacity (Qualitative Analysis Only)
- 5.2.1 More than 1000 KW
- 5.2.2 100 to 1000 KW

5.2.3 Less than 100 KW
5.3 y End-User
5.3.1 Utilities
5.3.2 Industrial
5.3.3 Commercial
5.4 By Geography
5.4.1 North America
5.4.2 Europe
5.4.3 Asia-Pacific
5.4.4 South America
5.4.5 Middle East and Africa

6 COMPETITIVE LANDSCAPE

6.1 Mergers and Acquisitions, Joint Ventures, Collaborations, and Agreements
6.2 Strategies Adopted by Leading Players
6.3 Company Profiles
6.3.1 Nel ASA
6.3.2 Sempra Energy
6.3.3 GRT Gaz SA
6.3.4 MAN Energy Solutions
6.3.5 Sunfire GmbH
6.3.6 Ineratec GmbH
6.3.7 Electrochaea GmbH
6.3.8 MicroPyros BioEnerTec GmbH
6.3.9 Siemens Energy AG
6.3.10 Hitachi Zosen Inova AG
6.3.11 AquahydreX Inc.

7 MARKET OPPORTUNITIES AND FUTURE TRENDS

Power to Gas - Market Share Analysis, Industry Trends & Statistics, Growth Forecasts (2025 - 2030)
