## Market Analysis

The use of sustainable and renewable sources of energy like biomass to reduce carbon emissions is growing. Many governments around the world are developing favourable policies and concessions to promote the manufacturing of biomass energy. The need for renewables such as biomass has been further increased by the diminishing non-renewable energy sources like fossil fuels. With the growing use of biomass, raw materials such as timber pellets, thin, unused wood, and palm kernel coats would be widely demanded. Thus, the expansion of the global biomass industry over the forecast period 2025-2034 is expected to drive the wood recycling market growth.

The market for paper has been boosted by factors like rapid urbanization and a growing literacy rate. Due to the large population as well as the increasing consumers power in China and India, the Asia Pacific region is projected to provide substantial growth potential for the wood recycling market. The demand for wood waste products in Europe, including wood pellets and wood briquettes, is mainly driven by an increased use of renewable energy. Some European countries are concentrating more on renewable energy production, for example, biomass, thus aiding the growth of the wood recycling market.
